Class 4 EVS — CA-1 (Medium) — Answer Key

Class : 4

Subject : EVS (Our Wondrous World)

Max Marks : 50

Duration : 1 Hr 30 Min

Syllabus: Chapters 1–3 — Living Together, Exploring Our Neighbourhood, Nature Trail

General Instructions: All questions are compulsory. For Section A, write the correct option letter.

ANSWER KEY

SECTION A — Multiple Choice Questions (1 Mark each)

1. Which of these best explains why humans developed communities rather than living entirely alone? (1 Mark)

A. Living alone is always easier

B. Cooperation and shared roles allow needs like food, safety, and education to be met more effectively ✓

C. Communities have no benefits

D. Humans dislike other people

2. What is the main purpose of observing and mapping a neighbourhood, as described in "Exploring Our Neighbourhood"? (1 Mark)

A. To avoid learning about the area

B. To build a clear understanding of the area's layout and features ✓

C. To make the area more confusing

D. It has no real purpose

3. Why might a nature trail be designed to include a variety of plants and habitats? (1 Mark)

A. To make the trail longer for no reason

B. To allow observers to see a wider range of species and ecological relationships ✓

C. Variety has no educational value

D. To confuse visitors

4. How might the roles people play in a community (like teachers or shopkeepers) change if a community faced a shortage of one type of worker? (1 Mark)

A. Nothing would change

B. The community might face difficulties in that specific area, showing how much they depend on each role ✓

C. All roles are equally replaceable with no impact

D. Communities do not need workers

5. Why might exploring your neighbourhood help you understand the concept of "urban" versus "rural" areas? (1 Mark)

A. It has no connection to this concept

B. Observing features like building density and transportation can reveal whether an area is more urban or rural ✓

C. All neighbourhoods are identical

D. This concept is unrelated to EVS

6. What might careful observation on a nature trail teach us about interdependence in nature (like bees and flowers)? (1 Mark)

A. Nothing about interdependence

B. It can show how different living things rely on each other, such as bees helping pollinate flowers ✓

C. Plants and animals never interact

D. Interdependence is not observable

7. Why is understanding different family structures important for building empathy? (1 Mark)

A. It is not important

B. It helps us understand and respect that families can look different while still providing love and support ✓

C. Understanding families has no connection to empathy

D. All families are exactly identical

8. Why might a neighbourhood with many parks and green spaces be considered beneficial for its residents? (1 Mark)

A. Green spaces have no benefit

B. Green spaces can provide places for relaxation, exercise, and connecting with nature ✓

C. Green spaces only take up space

D. Residents dislike green spaces

SECTION B — Short Answer Questions (2 Marks each)

1. Explain how the roles of different community members (like farmers, teachers, doctors) are interconnected and dependent on each other. (0 Marks)

► Farmers grow food that feeds teachers and doctors, teachers educate the children of farmers and doctors, and doctors care for the health of farmers and teachers - showing that these roles rely on each other to keep the whole community functioning well.

2. Why might mapping a neighbourhood help identify areas that need improvement, such as a lack of parks or unsafe roads? (0 Marks)

► Mapping a neighbourhood visually organises information about its features, making it easier to notice gaps or problems, such as areas without green spaces or roads without proper footpaths, which can then be addressed.

3. Explain how observing a nature trail over different seasons might show different things each time. (0 Marks)

► Different seasons bring changes like new leaves in spring, various flowers blooming in summer, or different animal behaviours preparing for winter, meaning a nature trail observed across seasons would reveal a much richer and more varied picture of the ecosystem than a single visit.

4. Why might larger joint families have both advantages and challenges compared to smaller nuclear families? (0 Marks)
- Joint families can offer more support, shared responsibilities, and companionship due to more members living together, but they might also face challenges like less privacy or the need for more coordination among many family members, compared to smaller nuclear families.
5. Explain how transportation systems in a neighbourhood can affect the daily lives of its residents. (0 Marks)
- Good transportation systems, like accessible buses or safe roads, make it easier for residents to travel to work, school, or markets, while poor transportation can make daily tasks more difficult and time-consuming, directly affecting quality of life.
6. Why is it important to observe both living things (plants, animals) and non-living things (rocks, soil) on a nature trail? (0 Marks)
- Both living and non-living things interact and depend on each other in an ecosystem - for example, soil provides nutrients for plants - so observing both gives a more complete understanding of how the natural environment functions as a whole.
7. Explain why a community with diverse roles (not everyone doing the same job) tends to function better than one where everyone does the same work. (0 Marks)
- A community with diverse roles ensures that different essential needs - like food production, education, healthcare, and trade - are all met, whereas a community where everyone does the same work would likely struggle to fulfil all these different needs on its own.
8. Why might exploring your neighbourhood on foot reveal different details than exploring it by car? (0 Marks)
- Walking allows for a slower pace and closer observation of small details, sounds, and interactions, while travelling by car covers more distance quickly but often misses finer details, showing that the method of exploration affects what we notice.
9. Explain the relationship between respecting nature (as taught in Nature Trail) and taking responsibility for community spaces (as taught in Exploring Our Neighbourhood). (0 Marks)
- Both lessons teach a similar value of care and responsibility - respecting nature means not harming plants, animals, or their habitats, while taking responsibility for community spaces means keeping shared areas like parks and streets clean and well-maintained, showing that care extends to both natural and human-made environments.
10. Why might a community's social harmony be tested during a disagreement, and how might it recover from this? (0 Marks)
- Disagreements can create tension between community members, but social harmony can recover through open communication, fair resolution by trusted leaders or elders, and a willingness from community members to compromise and move forward together.

SECTION C — Short Answer Questions (Explain) (3 Marks each)

1. Explain in detail how the concept of "community" extends beyond just family, using examples from "Living Together". (0 Marks)
- While family is usually our closest, smallest social group, a community includes a much larger group of people, such as neighbours, teachers, shopkeepers, and local leaders.
 - Even though we may not be related to most community members, we still depend on them for various needs, such as buying food from a shopkeeper or learning from a teacher.
 - This shows that "community" is a broader network of social relationships that supports us in ways beyond what our immediate family alone can provide.
2. Describe the skills you would need to successfully explore and create an accurate map of your neighbourhood, and explain why each skill is important. (0 Marks)
- Observation skills are needed to notice and remember important features like roads, buildings, and landmarks accurately.
 - Basic drawing or sketching skills are needed to represent these features visually on a map in a way that is clear and proportionate.
 - Organisational skills are needed to arrange these features in the correct relative positions, ensuring the map is actually useful for understanding the neighbourhood's layout.
3. Explain how a nature trail can help students understand the concept of an ecosystem, even without using that specific scientific term. (0 Marks)
- On a nature trail, students can observe how plants provide food and shelter for insects and animals, showing a basic relationship between different living things.
 - They might also notice how non-living things, like sunlight, water, or soil, support the growth of plants, which in turn supports animal life.
 - Even without explicitly using the term "ecosystem," this hands-on observation helps students intuitively grasp the idea that living and non-living things are all connected and dependent on each other within a natural environment.
4. Discuss how observing different types of families in "Living Together" can help build a more inclusive understanding of society. (0 Marks)
- Learning that families can take many forms - such as nuclear, joint, single-parent, or extended families - helps students understand that there is no single "correct" family structure.
 - This understanding builds empathy and reduces the risk of students feeling that their own family situation is unusual or lesser compared to others.
 - An inclusive understanding of diverse family structures helps create a more accepting and respectful society, where different types of families are all valued equally.

SECTION D — Long Answer Questions (5 Marks each)

1. Write a detailed essay analysing how "Living Together", "Exploring Our Neighbourhood", and "Nature Trail" together build a child's understanding of the connections between social communities, human-made environments, and the natural world. (0 Marks)

- "Living Together" introduces the idea that humans are social beings who form families and communities, relying on different roles and relationships to support one another.
- "Exploring Our Neighbourhood" extends this understanding by teaching students to observe and analyse the human-made environment - buildings, roads, and transportation - that communities create to meet their needs.
- "Nature Trail" further extends this understanding to the natural world, teaching students to observe and appreciate plants, animals, and ecological relationships in their environment.
- Together, these three chapters show students that their world consists of interconnected layers - social relationships, human-made structures, and natural ecosystems - all of which interact and depend on each other, building a comprehensive, well-rounded understanding of the world they live in.

2. Design a "community and nature walk" activity that combines ideas from all three chapters (Living Together, Exploring Our Neighbourhood, Nature Trail). Describe the activity in detail, including what students would observe and learn at each stage. (0 Marks)

- This is a creative, open-ended design task; there is no single correct answer, but strong responses should thoughtfully combine all three chapters' themes.
- A strong answer might design a walk starting at a local community space (like a market or community centre) to observe different community roles and interactions (Living Together), moving through residential streets to observe buildings and transportation (Exploring Our Neighbourhood), and ending at a nearby park or green space to observe plants and animals (Nature Trail).
- The explanation should clearly connect each stage of the walk back to the specific themes and lessons from the three chapters, showing a thoughtful integration of social, environmental, and observational learning into one cohesive activity.
