(Swap in your school's actual letterhead / logo here)

CA-1 (Chapters 1–3)

Class : V

Max Marks : 70

Subject : Mathematics

Duration : 2 Hr 30 Min

Syllabus: We the Travellers–I • Fractions • Angles as Turns

General Instructions: All questions are compulsory. Read each question carefully before answering.

Section A — 1 Mark Each

1. Which number has the same nearest ten and nearest hundred? (a) 7,126 (b) 7,835 (c) 6,999 (d) 7,030
2. If $\frac{1}{3} = \frac{2}{x}$, find the value of x .
3. Which fraction is the greatest: $\frac{5}{9}$, $\frac{5}{7}$, or $\frac{5}{12}$?
4. Starting from South, you make a full turn clockwise. Which direction do you end up facing?
5. 3 right angles equal how many quarter turns?
6. Find the value: $10,000 + 900 + 20 + 4$
7. True or False: An angle can be both acute and a full turn at the same time.
8. How many zeros are there in the number 60,000?

Section B — 2 Marks Each

9. Choose the digits 1 and 9. Form two 2-digit numbers and find the result of the first subtraction only.
10. Explain in one line why the repeated-subtraction digit puzzle always ends at 9, no matter which two different digits are chosen.
11. For the digits 2 and 8, find (difference of digits) $\times 9$, and check it against $82 - 28$.
12. Compare $\frac{3}{9}$ and $\frac{4}{8}$ using two methods: (i) simplifying each fraction (ii) comparing with $\frac{1}{2}$.
13. Give one example of a number whose nearest hundred and nearest thousand are the same, and explain why this happens.
14. If the minute hand turns $\frac{4}{12}$ of a full turn from 12, how many minutes does this represent, and what is $\frac{4}{12}$ in its simplest form?
15. Starting from West: turn 3 right angles clockwise, then $\frac{1}{2}$ right angle clockwise, then another $\frac{1}{2}$ right angle clockwise. Find the final direction.
16. Find the fraction equivalent to $\frac{5}{9}$ with numerator 25, then compare it with $\frac{25}{54}$.
17. Ravi's car has been driven 56,987 km and Sheetal's car 67,543 km. Round each distance to the nearest ten-thousand and compare using only the rounded values.
18. Using the digits 4, 8, 2, 4, 7 (each used exactly once, as given), write the smallest and the largest possible 5-digit numbers.
19. The nearest thousand of 45,867 is found, and then 3 is added to it. Find the resulting number and its nearest hundred.

20. Find the value of 90 Tens + 83 Ones, and also of 700 Tens + 34 Ones. What is the difference between the two?
21. Four quarter turns are made one after another in the same direction. Name the resulting turn, and explain why it cannot be called an acute, right, obtuse, or straight angle.
22. Arrange the fractions $\frac{7}{8}$, $\frac{3}{8}$, $\frac{5}{8}$, $\frac{1}{8}$ from smallest to largest.

Section C — 3 Marks Each

23. A cyclist travels at 15 km/hr and a motorbike at 50 km/hr. In 3 hours, how much farther does the motorbike travel than the cyclist? Show your working.
24. Rearrange the digits of 48,247 (using all 5 digits) to form the smallest possible 5-digit number and the largest possible 5-digit number. State both.
25. A school has 461 girls and 439 boys. If the school uses exactly 24 Minibuses (25 seats each) first, how many students remain, and how many Boats (20 seats each) are needed to carry them with no seats empty?
26. Compare $\frac{12}{9}$ and $\frac{4}{5}$ using 1 (a whole) as a reference. If these represent pizzas eaten, which represents 'more than one full pizza'?
27. A giant wheel passenger completes 5 quarter turns in the same direction from the starting point. How many full turns and extra turns is this? Name the angle formed by the extra turn.
28. Find the missing values: $37,608 = \underline{\hspace{1cm}}$ Ten Thousand + 17 Thousand + $\underline{\hspace{1cm}}$ Hundreds + 8 Ones. Show your reasoning.

Section D — 4 Marks Each (Word / Application Problems)

29. Town populations: Town 1 = 65,232; Town 3 = 56,380; Town 5 = 45,858; Town 6 = 66,540. (a) Arrange in descending order. (b) Round each to the nearest thousand. (c) State which towns' populations round up and which round down, with reasons.
30. Choose two digits whose difference is 5. Form the two possible 2-digit numbers, subtract, and continue the process (using the digits of each new result) until you reach a 1-digit number. Show at least 2 subtraction steps.

Section E — 2 Marks Each (From Your Textbook)

31. Take the digits 3 and 7. Form the two possible 2-digit numbers, subtract the smaller from the bigger, and repeat the process with the digits of each new result until you reach a 1-digit number. Show all your steps.
32. Rearrange the digits of 48,247 (using all 5 digits) to form the largest possible 5-digit number.
33. Give one valid combination of exactly 7 fraction-kit pieces (from halves, thirds, quarters, fifths, sixths, eighths, or twelfths) that add up to a whole, and show your working.
34. In the 'pile of pebbles' game, each pile starts with 7 pebbles; players alternate taking any number of pebbles from one pile, and whoever takes the last pebble wins. If it is your turn with piles of (2, 2) remaining, describe and explain a strategy to try to win.
